Fly Season

When To Begin Application

ClariFly® is a seasonal additive. Calves should begin consuming ClariFly® in their feed 30 days before the start of spring fly season for maximum protection. The map below shows the start of fly season across the United States. In general, calves should be consuming ClariFly® beginning in March or April. Southern regions may need to begin application in February.

When To End Application

Continue ClariFly® until 30 days after the first frost. In general, calves should consume ClariFly® through October. Further south, application may need to continue through November.

Start of Spring Fly Season

First Frost

Ordering ClariFly® in Medicated Milk Replacer

Fly season will typically be 7 to 9 months long, and begin in March or April. You should plan on placing orders for your ClariFly® milk replacers at least one month before they are needed on the farm. If your ClariFly® season begins April 1, next year you should begin to order your ClariFly® milk replacers by the end of February to allow for manufacturing and distribution to the farm.
